# Password Generator

Presented by Kazi Zilani

---

---

# Objectives

- Validate software concept and test feasibility
- Reduce exposure to risk
- Demonstrate usability and user interaction
- Gather early feedback and make data driven engineering decision
- Gather technical insights to drive later development directions and make informed decisions

---

# System Overview

## Key Features

- 64 character long password using standard pool
- Regenerate and copy password
- User option to choose password characteristics
- Entropy, bit, crack time, and strength indicator

---

# Process & Lifecycle

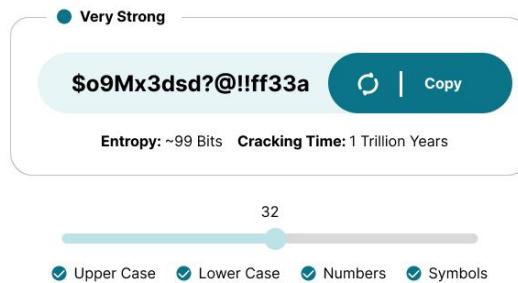

- **Process:** Waterfall Method
  - **Lifecycle:**
    - Planning
    - Analysis
    - Design (Figma Prototype)
    - Implementation (Web-Based)
    - Testing & Integration
    - Maintenance
-

---

# Scope, Budget, & Risk

- The minimum viable product approach
- Validating core concepts to keep the budgets low, and initial cost and scope limited
- Prevent scope creep

# Mockup & Prototype

---

# Conclusion & Recommendation

1. Responsive design
2. Reduce load time and increase performance
3. Add password manager and alert for breach
